Java Card 3 Programming
Michel Koenig

TD 2

This exercise is based on the EPurse which was programmed in the TD1. We want to memorize the last operations done on the EPurse. The project provided with this exercise contains the skeleton of two new classes: Operation and OperationList. The first one is a smart storage for the data linked to an operation, the second one manages the array of operations. Specifications of what you have to do are provided to you as comments.
